Sending an Array

Sending an Array, Untyped

The socket is **untyped**.
What could go wrong?

Sending an Array, Simple

```
msg(S,int)::repeat(n, msg(S,int))::end(C)
```

↓
send(socket, payload)
recv(socket)

```
repeat(n, msg(S,int))::end(C)
```

Server
send(len)
loop(len)
wait

Client
recv
malloc
loop(len)
close

The socket is typed using **simple** session types.
Linear types guarantee correct order and no leak.
What else could go wrong?

Sending an Array, Dependent

`quan(S, $\lambda n: \text{int}$. \text{msg}(S, \text{int}(n)) :: \text{repeat}(n, \dots`

`exists(socket)`

`forall(socket)`

`$\forall n: \text{int}$. \text{msg}(S, \text{int}(n)) :: \text{repeat}(n, \dots`

`$\exists n: \text{int}$. \text{msg}(S, \text{int}(n)) :: \text{repeat}(n, \dots`

Server

`send(len)`

`loop(len)`

`wait`

Client

`recv`

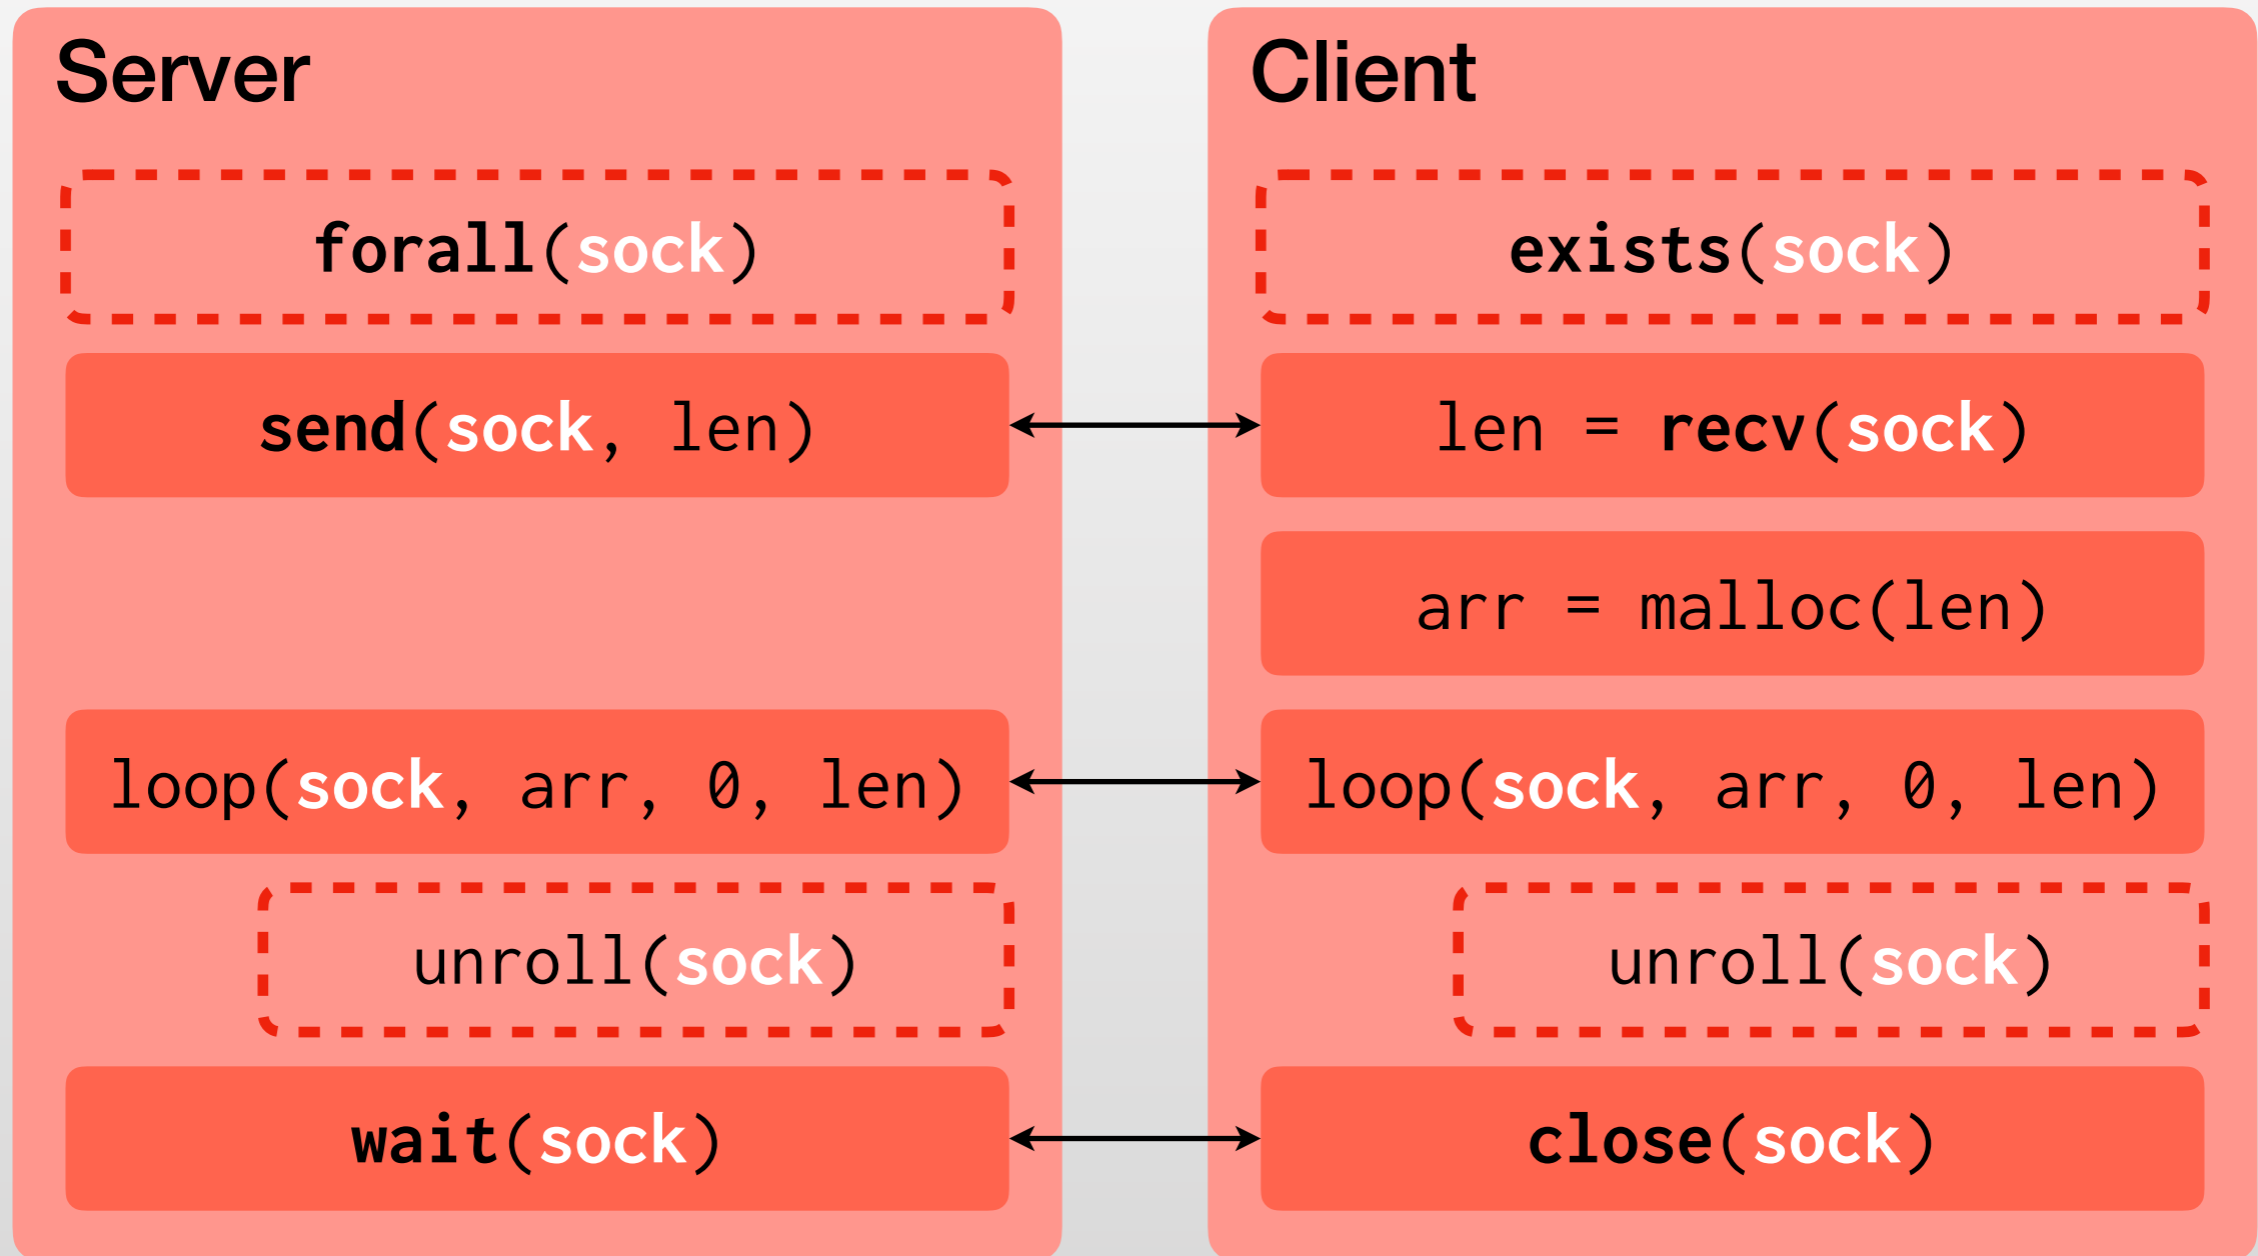

`malloc`

`loop(len)`

`close`

The socket is typed using **dependent** session types.
Nothing could go wrong.

Sending an Array, Dependent

Show Me the Code

```
rpt(n,s) := fix(n,λf:int→stype.λn:int.ite(n>0,s::f(n-1),end(1)))
```

```
proto := quan(S,λn:int.msg(S,int(n))::rpt(n,msg(S,int)))
```

```
server ∀n.int (ch:sock(S,proto), arr:int[n], len:int(n)) =  
  let loop ∀m.int,m≤n (ch:sock(S,rpt(m,msg(S,int))), x:int(m)) =  
    if x = 0 then  
      unroll(ch); ite_false(ch); close(ch)  
    else  
      unroll(ch); ite_true(ch); send(ch,arr[len-x])  
      loop(ch,x-1)  
  in  
    forall(ch); send(ch,len); loop(ch,len)  
end
```

Takeaway

untyped sockets

- runtime errors
- hard to debug
- deadlock
- resource leak

simple session types

- type errors
- correct use of sockets
- deadlock-free
- no leak

dependent session types

- more expressive
- quantifiers
- recursions
- polymorphic sessions

Even More

Formulation
Lambda Calculus + Some

Logic Foundation
Multirole Logic, Cut-Free

Bi-directional Forwarding

Used in Classrooms

Higher-order Sessions

Implementations
Erlang, C, Javascript

Multiparty Sessions

Multi-directional Forwarding

Proof of Deadlock-Freeness
